

SETTING UP A WIFI HOTSPOT ON AN IOS DEVICE

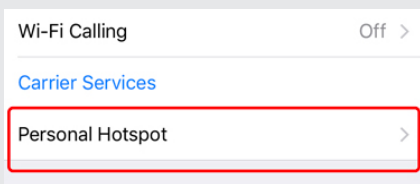

1. Go to **'Settings'**

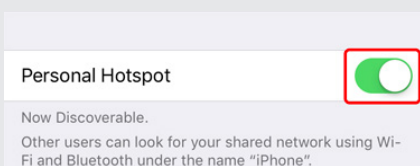

2. Click **'Mobile Data'** or on some mobiles, there will be a **'Personal Hotspot'** shortcut under the mobile data option

3. If you selected **'Mobile Data'** first, click **'Personal Hotspot'**

4. Tap the slider to turn the personal hotspot on

5. If WiFi and/or Bluetooth are off, you will be prompted to turn them back on. This is the easiest option. The alternate would be connecting the device requiring the hotspot to the mobile via a USB, however, this is the most secure method

6. Click **'WiFi Password'** and enter a secure and strong password
7. Then on the device that requires the hotspot, go to the WiFi connections list and select the name of your connection e.g. "Ragnar's iPhone"
8. Enter the password that you created in step 5. You should then be able to use the internet on this device as normal, as well as on your mobile. This will run off your mobile 3G or 4G data
